

APBG MASTER HANDBOOK · PART I · USER GUIDE

Running a Production Run Click by Click

One run of Hangar 25 Cola, from “we need 500 cases” to 500 cases on the warehouse shelf with every case traceable to a lot code — with a picture of every screen and a 20-step test script at the end.

Owner Sky Pace · **Last reviewed** 2 September 2026

System Refractor → Production · alamedapointbg.com/margin

Screens in this document are the real application with real bill-of-materials data.

This is the walkthrough: one run of Hangar 25 Cola from "we need 500 cases" to "500 cases are on the warehouse shelf and every case traces back to a lot code". Chapter 10 is the reference for what each tab holds; this chapter is what to click, in order, with a picture of every screen.

There is a **test script at the end**. If you are checking the system rather than running a real batch, start there and use the rest of the chapter as the map.

Screens in this chapter are the real application with real BOM data. Your numbers will differ; the buttons will not.

Before you start

Sign in at alamedapointbg.com and open **Refractor** (the Margin app). In the left sidebar choose **Production**.

At the top of the Production page is a **lane** switch — **BIB Product** and **Cans 24pks**. Everything in this chapter is the **Cans 24pks** lane. The lane decides which formulas, BOMs and work orders you see; picking the wrong one is the usual reason "my BOM has disappeared".

Six tabs run left to right roughly in the order you use them:

TAB	WHAT IT IS FOR
Formulas & Spec Sheets	The recipe — % by weight, QC specs, batching instructions
Materials & Pricing	What each purchased thing costs and who we buy it from
Bills of Materials	The parts list for one case, and who gets a purchase order
Work Orders	The run itself, start to finish
Purchase Orders	The vendor POs a run raises, and receiving against them
Compliance & Safety	Certificates and audit paperwork (not part of a run)

Step 1 · Check prices and vendors

Production → Materials & Pricing → Purchased items & vendors.

Purchased items & vendors

20 items · 2 vendors

Reload

This is where a price or a supplier changes. Every work order prices its purchase orders from this table, and groups them by the vendor set here — so moving the cans from one supplier to another is one change, not seven. A BOM line can still override a single item for a single flavour, nothing else beats this. The QuickBooks purchase cost is shown alongside for comparison and is never written to. ⚠️ 7 prices are still the QuickBooks figure this table was seeded from — confirm against the vendor's current sheet and save to clear the flag.

Materials & Pricing — the purchased-item master, grouped by vendor

Every purchased component has **one** vendor and **one** price here, grouped by vendor so the page reads as "here is Quantum's order, here is Calderoni's". This is the master: a bill of materials only overrides it when a particular product genuinely buys that part from someone else.

Prices seeded from QuickBooks carry the note *"seeded from QuickBooks purchase cost — confirm"* until somebody saves them. **A seeded price is a guess.** The QuickBooks cost is shown beside ours for comparison and is never written to.

Change a price here and every future run picks it up. Runs already created keep the price they were costed at — a work order snapshots its materials, so editing this page cannot rewrite a batch that is already in flight.

Step 2 · Check the bill of materials

Production → Bills of Materials. One row per sellable finished item.

12

WHO GETS A PURCHASE ORDER · 2 POS PER RUN

AC CALDERONI*
1GNS6121 HANGAR 25 COLA · CANNING RUN FEE (SYRUP COMPOUNDING)

Quantum Canning
12OZ CAN FILL LABOR · CAN HANGAR 25 COLA 12OZ SLEEK EMPTY · VELCORIN 12OZ CAN · DUNNAGE FEE PER PALLET

A run raises one purchase order per vendor on this list. The ingredients are not counted here — they ride under the flavour's gallon line as detail, so they never become a PO line of their own.

RECIPE — FROM THE FORMULA, PER 1 CASE

Rebuild from formula

MATERIAL	% BY WEIGHT	PER CASE	VENDOR	ON THE BOM?
Filtered Water	87.8819%	16.60968 lbs	—	sourced on site
Cane Sugar	11.6700%	2.20563 lbs	AC CALDERONI*	yes
Cola Flavor	0.4381%	0.08280 lbs	AC CALDERONI*	yes
Sodium Gluconate	0.0100%	0.00189 lbs	AC CALDERONI*	yes

HOW THE CONCENTRATE VOLUME IS WORKED OUT

A case is $24 \times 12 \text{ oz} = 2.25 \text{ gal}$ of finished soda. At **5:1** the concentrate is one part in 6 — **0.375 gal per case**, which is what the gallon line below carries. It is computed, not typed.

Cross-check: every material here ends up inside that concentrate — $2.29032 \text{ lb in } 0.375 \text{ gal} = 6.108 \text{ lb per gallon}$ — **consistent with a 5:1 syrup**.

These materials are **billed inside the flavour's 1-gallon line** below — the purchase order shows every quantity so the supplier knows what to buy, but QuickBooks sees one gallon line at the gallon price. Rebuilding replaces the recipe and recomputes the gallon quantity; the vendor, the price, the cans and the co-packer charges are yours and are never touched.

SUB-ITEMS (PER 1 FINISHED UNIT)

TYPE	SUB-ITEM / SERVICE	QTY	PER	UOM	SCRAP %	EST UNIT \$	VENDOR

NOTES

Auto-built from formula Hangar 25 Cola — review quantities/vendors. TODO: add the printed 12 oz can body item (the per-flavor empty-can items are deleted in QBO).

Deactivate BOM

Cancel

Save BOM

The BOM editor, with the pre-flight at the top and the recipe below

Read it top to bottom:

- Who gets a purchase order.** The pre-flight, in the grey panel. It should say **2 POs per run** — AC Calderoni for the syrup and the compounding fee, Quantum Canning for the cans, the tolling charge, Velcorin and dunnage. If it names a third vendor, a component is pointed at the wrong supplier.

- 2. **Blockers, in red, stop a run.** The two that happen: a component that is **deactivated in QuickBooks** (QuickBooks will refuse the PO push, and you want to know now rather than at the push) and a component with **no vendor anywhere** — not on the line and not in Materials & Pricing.
- 3. **Warnings, in amber, do not stop a run.** The one that matters: a component whose QuickBooks type is **Inventory**. Everything we buy for a run should be *Service* or *Non-inventory*; only the finished cases we bring back into the warehouse are inventory items.
- 4. **Recipe — from the formula, per 1 case.** Sugar, flavour, acid and water, computed from the formula, not typed. Water is on the sheet (it is what makes the percentages total 100) and is deliberately never purchased.
- 5. **How the concentrate volume is worked out.** A case is 24 × 12 oz = 2.25 gal of finished soda; at 5:1 the concentrate is one part in six, so **0.375 gal per case**. The cross-check underneath states the syrup's solids loading and whether it sits in the normal band for a 5:1 syrup.
- 6. **Sub-items** — the things that actually get bought. Note the **Per** column: *per unit* scales with the run, **per run** is a flat charge for the whole work order however big it is. The syrup compounding fee is per run.

Rebuild from formula re-writes only the recipe rows from the current formula. It never touches the sub-items you typed (cans, tolling, Velcorin, dunnage) — those are yours.

Step 3 · Raise the work order

Production → Work Orders → + New Work Order.

The work-orders list

NEW WORK ORDER — HOW MANY FINISHED UNITS DO WE WANT MADE?

BOM (SELLABLE ITEM) QTY TO MAKE (FINISHED UNITS) BATCH SIZE (GAL) — FROM FORMULA CO-PACKER (VENDOR) CO-PACKER LOCATION (MATERIALS SHIP HERE) RECEIVE FINISHED GOODS AT SCHEDULED DATE

24P126121 HANGAR 25 COLA 500 1125 — QUANTUM-CANNING — Quant — mm/dd/yyyy

Formula: Hangar 25 Cola rev 1.7 · density 8.4 lbs/gal · batch weight = 9,450 lbs

THIS RUN RAISES 2 PURCHASE ORDERS

AC CALDERONI* — 1GNS6121 HANGAR 25 COLA · CANNING RUN FEE (SYRUP COMPOUNDING)

Quantum Canning — 12OZ CAN FILL LABOR · CAN HANGAR 25 COLA 12OZ SLEEK EMPTY · VELCORIN 12OZ CAN · DUNNIAGE FEE PER PALLET

BATCH PLAN — FILLING THE TANK

500 cases × 2.25 gal = 1,125 gal of finished soda.

The tank is finished product — the co-packer dilutes and carbonates. At 5:1 that run needs 188 gal of concentrate delivered, which is what the ingredient purchase order orders.

TANK	A FULL TANK MAKES	ADD TO FILL IT	
1,500 gal SMALLEST THAT HOLDS THIS RUN	666 cases 250 gal conc.	+166	375 gal of capacity unused as ordered
2,000 gal	888 cases 333 gal conc.	+388	875 gal of capacity unused as ordered
2,500 gal	1,111 cases 417 gal conc.	+611	1,375 gal of capacity unused as ordered

Tank sizes come from the formula, so a flavour that cannot run in a given tank simply does not list it. Clicking a +n sets the order to a full tank.

MATERIALS THAT WILL BE CALCULATED ONTO THIS WORK ORDER

Quantities are the recipe's own units. Where a material has a pack size on file the work order converts these to whole vendor packs — you cannot buy 0.4 of a bag — so the ordered figure on the purchase order rounds up from what is shown here.

SUB-ITEM	REQUIRED	VENDOR	EST UNIT \$	EST EXT \$
1GNS6121 HANGAR 25 COLA	188 gal	AC CALDERONI*	\$5.3800	\$1,009
CANNING RUN FEE (SYRUP COMPOUNDING)	1 run	AC CALDERONI*	\$1173.3300	\$1,173

		Estimated materials		\$14,092

NOTES

Cancel Create work order

The New Work Order form, with the batch plan and the material preview

Fill in seven fields: the **BOM**, **how many finished units**, the **batch size** (defaults from the formula), the **co-packer** and the **location materials ship to**, where **finished goods are received**, and the **scheduled date**.

Three panels then tell you what you are about to commit to:

- **This run raises 2 purchase orders** — the same pre-flight as the BOM.
- **Batch plan — filling the tank.** 500 cases × 2.25 gal = 1,125 gal of finished soda, needing 188 gal of concentrate. The table shows what each tank size makes and how many cases to add to fill it; clicking a +n rounds the order up to a full tank. The tank is *finished product* — the co-packer dilutes and carbonates.
- **Materials that will be calculated onto this work order** — every purchased line with its quantity, vendor, unit price and extension, and an **Estimated materials** total. Check that total before you press the button: it is what the two purchase orders will add up to.

Press **Create work order**.

Step 4 · Send the purchase orders

Open the new work order. It sits at **Draft**, and the whole run is a row of stages across the top:

Draft → POs issued → Materials at co-packer → In production → Yield recorded → Shipping to us → Received to inventory → Closed

The Calderoni purchase order — the syrup and the flat run fee

Per PO you can:

- **View PDF** — the branded purchase order. On the Calderoni PO the PDF also lists the ingredient breakdown underneath the gallon line, so the compounder can see how much sugar and flavour to buy. That detail is on the document, not on this screen.
- **Email...** — sends that exact PDF to the vendor and files a copy. **The PDF we email is the PDF we keep;** prices move and "what did we actually send them" must not.
- **Push to QBO** → — creates the purchase order in QuickBooks.
- **Receive** — type the quantity that arrived in the box on the line and press the truck. Receiving is per line, so a part shipment is fine.
- **Close** force-closes any unreceived lines; **Void** cancels the PO.

Back on the work order, press **Materials at co-packer** when the goods have landed, then **Start production** → when the co-packer begins. Starting production consumes the material quantities from the co-packer's location, so only press it when it is true.

Step 5 · Record the yield and the lot codes

This is the step this chapter exists for.

Press **Record yield** → .

9/2/2026, 6:34:20 AM 2 purchase order(s) generated

9/2/2026, 6:34:20 AM Raw materials at co-packer

9/2/2026, 6:34:20 AM Production started at co-packer (raw materials consumed)

NOTES

Run scheduled with Quantum for the 9/15 pickup.

RECORD YIELD — WHAT DID THE CO-PACKER ACTUALLY PRODUCE?

ACTUAL YIELD (UNITS, OF 500 PLANNED)
500

CO-PACK FEE \$

FREIGHT \$

OTHER LANDED \$

YIELD DATE
mm/dd/yyyy

100.0% of plan

LOTS — LOT CODE · BORN ON · BEST BY · CASES

Optional here — the co-packer's lot codes and born-on dates can also be entered before shipping. If entered, the lot quantities must add up to the yield.

LOT CODE	BORN ON	BEST BY	CASES	NOTES
Q375	09/16/2026	09/16/2027	210	notes
Q379	09/16/2026	09/16/2027	205	notes
Q390	09/17/2026	09/17/2027	85	notes

Add lot

2 lots, 500 cases, contribute the yield

Brix Beverage · Running a Production Run

11

Recording the yield with the co-packer's lot codes

Enter the **actual yield** — how many cases the co-packer really made — plus the co-pack fee, freight and any other landed cost, and the yield date. The panel prints the yield as a percentage of plan as you type.

Then the lots. For each batch the co-packer ran, press **+ Add lot** and enter:

FIELD	WHAT GOES IN IT
Lot code	The co-packer's own batch code, exactly as printed on the can
Born on	The production date coded on the can
Best by	The expiry, if they print one
Cases	How many cases came out of that lot
Notes	Anything worth remembering about that batch

⚠ **The lot quantities must add up to the yield.** A case is in exactly one lot, so $210 + 205 + 85 = 500$ lands and anything else is refused with both numbers in the message. The line under the table turns green and reads "3 lots · 500 cases — matches the yield" when it balances.

Press **Record yield + lock costs**. The cost rollup is computed and frozen: materials, services and fees, total, and unit cost per case, per can, per oz and per gallon.

Lots are optional at this point — you can enter them later with **Edit lots** on the work order, or in the Ship dialog — but they must exist before the shipment goes out, because the BOL prints one line per lot.

Create production PO →

The shipping dialog — carrier, tracking, and the lots the BOL will carry

Enter the **carrier**, **tracking #**, **PRO #** and **ship date**. The note at the bottom states exactly what the bill of lading will carry — one line per lot, each with its born-on date. If a lot is wrong, fix it with **Edit lots** before shipping, not after.

Press **Ship it**. A real BOL transfer is created from the co-packer's location to the warehouse and the stage moves to **Shipping to us**.

NOTES

Work order WO-2026-00008 — finished goods return

View BOL PDF

Email...

Mark Received

The BOL, one line per lot

Three lots, three lines, each with its lot code and born-on date. **View BOL PDF** renders the document the driver carries — with Lot and Born-on columns, and best by as a sub-line — and **Email...** sends it and files the copy.

Mark Received when the pallets arrive. Or do it from the work order with **Receive into inventory** → , which is the same thing said from the other end: the finished cases land in the warehouse and the stage moves to **Received to inventory**. Then **Close work order**.

Where a lot ends up

Every inventory movement points at the transfer *line* that carried it, and the line carries the lot — so each case that moved can be traced to the batch it came from without a second copy of the lot code anywhere.

If somebody asks "which stores got lot Q379", that is the recall query, and it is one read of `ops.v_lot_trace` : lot → run → BOL → ship and receive dates → how many movements it touched.

The documents

Three PDFs, one design, all branded the same:

DOCUMENT	WHERE
Purchase order	Purchase Orders → open a PO → View PDF / Email...
Bill of lading	Stock → Transfers → open a BOL → View BOL PDF / Email...
Batching sheet	Formulas (at any batch size) or the work order (sized to the run) → Batching sheet / Email sheet...

Every emailed document is filed before it is sent, and the send is logged, so the copy on file is the copy the vendor received.

QC test script

Run this against a **test flavour and a small quantity** — not a batch anyone is actually about to make — and delete the work order afterwards. Each step says what should happen; anything else is a finding.

#	DO THIS	IT SHOULD
1	Production → Materials & Pricing	List every purchased item grouped by vendor, each with a price and a vendor. Nothing blank.
2	Change a price, save, re-open	Keep the new price; the note about being seeded from QuickBooks is gone
3	Bills of Materials → open one	Show 2 POs per run, 0 blockers
4	Read the sub-items Per column	The syrup compounding fee is per run ; everything else is per unit
5	Work Orders → + New Work Order , pick the BOM, enter 100 units	Batch plan and material preview appear; Estimated materials is roughly a fifth of a 500-case run, and the run fee line stays 1 run at its full price
6	Create work order	Lands at Draft
7	Generate POs per vendor →	Exactly two POs; the materials table shows ☒ on P0 on every line
8	Purchase Orders → open each → View PDF	Both PDFs render; the Calderoni one lists the ingredient breakdown under the gallon line
9	Receive one PO line short (say 10 of 100)	The line shows the partial; the PO goes to partial , not closed
10	Work order → Materials at co-packer → Start production →	Stage advances; the timeline records both
11	Record yield → , enter a yield of 100, add lots totalling 90	Refused , naming both numbers
12	Fix the lots to total 100 → Record yield + lock costs	Accepted; cost rollup appears with a unit cost; the timeline records the lots
13	Edit lots , change a lot code, save	The new code shows on the work order
14	Create shipping record →	The note lists one line per lot before you commit
15	Ship it	A BOL number appears; stage is Shipping to us
16	Stock → Transfers → open that BOL	One line per lot , each with its lot code and born-on date
17	View BOL PDF	Lot and Born-on columns are on the document
18	Mark Received (or Receive into inventory →)	Finished cases appear in warehouse stock; stage is Received to inventory
19	Close work order	Stage is Closed and no action buttons remain
20	Switch the lane to BIB Product	The tabs collapse to Purchase Orders only — the cans pipeline belongs to the cans lane, and the switch really does scope the page. Switch back to Cans 24pks .

Found something? Note the work-order number, the step number and what you saw instead, and send it to Sky. A screenshot of the screen with the wrong number on it is worth more than a description.

Things that are deliberate, not faults

- **A case BOM shows cans, a tolling charge, Velcorin and dunnage but no water.** Water comes out of the wall at the co-packer and is never purchased. **And no tray** — the 24-pk tray came off every BOM on 2026-09-02 because it appears on no Quantum invoice; the tolling charge is taken to cover it.
- **The ingredient list does not become PO lines.** Sugar, flavour and acid ride underneath the flavour's 1-gallon line as detail. Calderoni bills us per gallon of compounded syrup, so the gallon is the line and the ingredients are the specification.
- **A flat fee does not scale.** The syrup compounding fee is \$1,173.33 whether the run is 100 cases or 5,000.
- **The dunnage line is fractional.** Pallets are charged per pallet and a run is rarely a whole number of them; the purchase order rounds up.
- **Nothing posts to QuickBooks on its own.** A PO reaches QuickBooks when somebody presses **Push to QBO**.
